

Endless possibilities for scrims

B AFA-laid scrims offer solutions for strengthening and stabilising a variety of products, providing highly-specialised reinforcements for technical applications.

Germany's BAFATEX Bellingroth said the application possibilities are unlimited through the combination of high functionality and individual design. The unique process bonds warp and weft yarns at their crossing point, employing a wide range of natural and man-made fibre yarns.

New applications are in glass doors to offer additional security against splitting, as well as in the interior glass used in yachts and boats. The scrims are also widely used to bond the back side of mosaic parquets to facilitate installation and provide high efficiency performance. Car seats with scrim laid inside the composites are said to offer increased levels of puncture resistance and durability.

The company will demonstrate the wide range of application areas for BAFA-laid scrims at Techtex^{til}.
